

CFTC Request for Input on Crypto-asset Mechanics and Markets

This answer was written by the «ZENITH» Protocol project team, whose goal is to introduce cryptocurrency into everyday life as a means of payment, as well as solve transaction security issues in the form of the possibility of their signing.

One of the problems of cryptocurrency, preventing its entry into everyday life as a means of payment, is its anonymity.

A partial solution to this problem may be the ability to sign transactions.

1. This will solve the issue of transparency of cryptocurrency circulation.
2. The development of a single transaction signing protocol will make it possible to identify payments and transfer of cryptocurrencies.
3. That will contribute to the fight against money laundering.
4. The resolution of disputes in the event of a conflict.
5. Transaction identification will allow cryptocurrencies to join existing payment systems.

The solution of the task of signing transactions is implemented in the «ZENITH» Protocol project.

«ZENITH» Protocol
